Are platelets cells?
(Not everyone agrees, since they are non-nucleate). And if platelets are cells - which all specialists consider at the time being - are they immune cells? The issue that platelets participate in immunity is no longer debated; however, the issue that they are

Access Free 3 Internal

key cells in immunity is challenged. It has even been proposed a couple of years ago that platelets can present antigen to T-lymphocytes by using their HLA class I molecules. No one has the same functional definition of platelets. The 'Frontiers Research Topic'- coordinators'

Access Free 3 Internal

own view is that platelets are primarily repairing cells, what they do in deploying tools of physiological inflammation. This function is better acknowledged as primary hemostasis, i.e. platelet adherence to injured or wounded vessels, followed by activation, aggregation, and

Access Free 3 Internal

Medicine U
Constitution of the initial clot. Platelets would thus repair damaged vascular endothelium; so doing, as they patrol to detect damages, they sense danger along the vascular arborescence. As the latter is immense, platelets get close to tissues, which are not allowed to them under

Access Free 3 Internal

‘physiological’

conditions but are readily accessible in pathology. Platelets are equipped with a variety of Pathogen Recognition Receptors such as TLRs; they have a complete signalosome, which is functional until the phosphorylation of NF κ B; they have been

Access Free 3 Internal

proved to retro-transcribe RNA and synthesize de novo proteins; etc. Platelets participate to inflammation along the whole spectrum: from physiological (tissue repair, healing) to acute/severe inflammation (as can be seen in e.g. sepsis). In general, platelets engage

Access Free 3 Internal

Medicine 44
Complex interactions with most infectious pathogens. We propose there to cover those topics - from physiology to pathology, that put platelets within cells that not only take place in-, but also are key players of-, innate immunity. The relation of platelets with adaptive immunity is

Access Free 3 Internal

even more complex.

Not everyone is convinced that platelets present antigens; however, platelets influence adaptive immunity since they have mutual interactions with Dendritic cells, Monocytes/Macrophages, and B-lymphocytes (the key players of antigen presentation);

Access Free 3 Internal

they also have mutual interactions with T-lymphocytes, though this issue is less clearly deciphered. We propose to also cover these topics - or to present the forum. There is another issue which is medically relevant - speaking of physiology/physiopathology-: this is fetal maternal

Access Free 3 Internal

incompatibility of platelet specific antigens (the HPA system) and the likely formation of maternal antibodies that often injure the newborn with risks of severe thrombocytopenia and intracranial hemorrhage. We propose an update on this issue as well. Last, platelets are

Access Free 3 Internal

very special because they can be directly therapeutic (by transfusion), even when being offered by a generous blood donor displaying given genetic and phenotypic parameters to a patient/recipient in need, who also display his/her own genetic and

Access Free 3

Internal

phenotypic Ut

parameters, which -
for a large part - differ
from the donor's ones.
Besides immunization
- via mechanisms
probably close to the
fetal maternal platelet
incompatibility, but
likely not similar -,
transfusion has
allowed the
identification of the
tremendous capacity

Access Free 3 Internal

of platelets to mediate inflammation: we propose to conclude the Topics with this item/forum.

Genome-wide association studies (GWAS) for complex disorders with large case-control populations have been performed on hundreds of traits in

Access Free 3 Internal

more than 1200
published studies (<http://www.genome.gov/gwastudies/>) but the variants detected by GWAS account for little of the heritability of these traits, leading to an increasing interest in using family based designs. While GWAS studies are designed to find common variants with

Access Free 3 Internal

low to moderate attributable risks, family based studies are expected to find rare variants with high attributable risk.

Because family-based designs can better control both genetic and environmental background, this study design is robust to heterogeneity and population

Access Free 3 Internal Medicine Ut stratification. Ut

Moreover, in family-based analysis, the background genetic variation can be modeled to control the residual variance which could increase the power to identify disease associated rare variants. Analysis of families can also help us gain knowledge about

Access Free 3 Internal

disease transmission and inheritance patterns. Although a family-based design has the advantage of being robust to false positives, novel and powerful methods to analyze families in genetic epidemiology continue to be needed, especially for the interaction between genetic and

Access Free 3 Internal

environmental factors associated with disease. Moreover, with the rapid development of sequencing technology, advances in approaches to the design and analysis of sequencing data in families are also greatly needed. The 11 articles in this book all introduce new

Access Free 3 Internal

Methodology and, using family data, substantial new findings are presented in the areas of infectious diseases, diabetes, eye traits, autism spectrum disorder and prostate cancer.
