This book provides engineering students a solid grasp of control system fundamentals by emphasizing physical understanding and practical applications. The topical organization of the book starts with an initial exposure to Laplace transform theory and then deals with the topics of conventional control theory thereby ensuring an uninterrupted smooth flow throughout the text. An appendix on state space theory has been given in order to enable the student who is in pursuit of advance level courses in control theory and DSP not to have a diffidence of not doing it. Features A physical and intuitive approach has been used so that this engineering textbook can be read by students with enthusiasm and interest. A lot of emphasis is given to physical understanding of the various concepts so that the reader can understand, formulate, and interpret the results of practical problems. Examples are worked out without sacrificing the rigor of the concept. These examples emphasize the concepts explained in each chapter. Each example is presented with a clear problem statement, and a detailed solution. The illustrations supporting the problems are drawn accurately to enhance the reader's understanding of the various solutions provided following the problem statement. Each chapter is supported by reinforcement problems to allow the students to tighten further their grasp on understanding the subject. Each chapter ends with a variety of homework problems to allow the students to test their understanding of the material covered in the text. Each chapter ends with a variety of homework problems to allow the students to test their understanding of the material covered in the text. Examples, reinforcement problems and exercise problems are time-tested. These problems have been used in class competitions, as well as in class tests. Text emphasizes on clarity of various concepts without sacrificing rigor and completeness. Calculators, computers and software tools are now available for solving a large variety of

problems. Thus, it is felt that, it is imperative for future engineers to understand the problems, not so much to be able to perform analytical manipulation of the equations. This text stresses the physical basis of conventional control theory, including only the necessary minimum of mathematics, which is derived as needed. Systematically prepares a student to face competitive examinations like GATE, IES etc.

This book is a text on Signals and Systems, at the Second year degree level. The purpose of writing this book was to provide the reader with a precise practical up-to-date exposition of Signals and Systems. Accordingly this book contains a wealth of material that trains a student to face the challenges posed by growing trends in communication, controls, signal processing and other allied areas. Features Reflects our passion towards teaching by explaining tough abstract concepts in a very convincing manner without compromising the concepts. Consistency is an essential requirement of conviction. Hence, care is taken to make the subject matter more consistent in respect of various symbols and their implications. Problems are graded to meet the needs of University examination as well as qualifying examinations like GATE, IES.... etc. Contents Fundamentals Linear Time - Invariant Systems Fourier Analysis and its Applications The Z-transform.

Contributed papers presented at the 7th National Conference on Air Breathing Engines and Aerospace Propulsion, hosted at I.I.T., Kanpur.

The book is a collection of high-quality peer-reviewed research papers presented in the first International Conference on Signal, Networks, Computing, and Systems (ICSNCS 2016) held at Jawaharlal Nehru University, New Delhi, India during February 25–27, 2016. The book is organized in to two volumes and primarily focuses on theory and applications in the broad areas of communication technology, computer science and information security. The book aims to bring together the latest scientific research works of academic scientists, professors, research scholars and students in the areas of signal, networks, computing and systems detailing the practical challenges encountered and the solutions adopted.
