As mentioned earlier, flow assurance is an engineering analysis process of developing a design and operating guidelines for the control of solids deposition in subsea systems. Depending on the characteristics of the hydrocarbons fluids to be produced, the processes corrosion, scale deposition, and erosion may also be considered in the flow assurance process.

This handbook provides a comprehensive but concise reference resource for the vast field of petroleum technology. Built on the successful book "Practical Advances in Petroleum Processing" published in 2006, it has been extensively revised and expanded to include upstream technologies. The book is divided into four parts: The first part on petroleum characterization offers an in-depth review of the chemical composition and physical properties of petroleum, which determine the possible uses and the quality of the products. The second part provides a brief overview of petroleum geology and upstream practices. The third part exhaustively discusses established and emerging refining technologies from a practical perspective, while the final part describes the production of various refining products, including fuels and lubricants, as well as petrochemicals, such as olefins and polymers. It also covers process automation and real-time refinery-wide process optimization. Two key chapters provide an integrated view of petroleum technology, including environmental and safety issues. Written by international experts from academia, industry and research institutions, including integrated oil companies, catalyst suppliers, licensors, and consultants, it is an invaluable resource for researchers and graduate students as well as practitioners and professionals.

designed to be used either individually or as a set, providing engineers with a thorough, detailed, ready reference on topics that may fall outside their scope of expertise. Each book provides discussion and examples as opposed to straight data and calculations, giving readers the immediate background they need while pointing them toward more in-depth information as necessary. Volume 4: Energy and Power covers the essentials of fluids, thermodynamics, entropy, and heat, with chapters dedicated to individual applications such as air heating, cryogenic engineering, indoor environmental control, and more. Readers will find detailed guidance toward fuel sources and their technologies, as well as a general overview of the mechanics of combustion. No single engineer can be a specialist in all areas that they are called on to work in the diverse industries and job functions they occupy. This book gives them a resource for finding the information they need, with a focus on topics related to the production, transmission, and use of mechanical power and heat. Understand the nature of energy and its proper measurement and analysis. Learn how the mechanics of energy apply to furnaces, refrigeration, thermal systems, and more. Examine the pros and cons of petroleum, coal, biofuel, solar, wind, and geothermal power. Review the mechanical parts that generate, transmit, and store different types of power, and the applicable guidelines. Engineers must frequently refer to data tables, standards, and other list-type references, but this book is different; instead of just providing the answer, it explains why the answer is what it is. Engineers will appreciate this approach, and come to

This book covers the fundamentals of drilling and reservoir appraisal for petroleum. Split into three sections, the first looks at the basic principles of well engineering in terms of planning, design and construction. It then goes on to describe well safety, costs and operations management. The second section is focussed on drilling and core analysis, and the laboratory measurement of the physico-chemical properties of samples. It is clear that efficient development of hydrocarbon reservoirs is highly dependent on understanding these key properties, and the data can only be gathered through a carefully conducted core-analysis program, as described. Finally, in the third section we look at production logging, an essential part of reservoir appraisal, which describes the nature and the behaviour of fluids in or around the borehole. It describes how to know, at a given time, phase by phase, and zone by zone, how much fluid is coming out of or going into the formation. As part of the Imperial College Lectures in Petroleum Engineering, and based on a lecture series on the same topic, Drilling and Reservoir Appraisal provides the introductory information needed for students of the earth sciences, petroleum engineering, engineering and geoscience.

Petroleum is produced from Onshore, Offshore Shallow water and Offshore Deep waters of the Niger Delta in Nigeria at depth of approximately 3,600m (12,000ft), by 5 major operators in partnership with the Nigerian National Petroleum Corporation (NNPC).

In Nigeria, associated stranded natural gas flaring commenced in 1956 with the first successful well drilled at Oloibiri by Shell D'Acry, present day Shell Petroleum Development Company (SPDC). According to SPDC, on the average, about 1,000scf of gas is produced with every barrel of oil, and presently about 40-50% of it is flared daily. The wasted associated stranded natural gas is mainly methane, a compound in great demand as chemical feedstock, commercial and industrial products, gas-to-methanol (GTM), liquefied natural gas (LNG), et cetera. Precisely, this work is motivated by four broad factors (a) the fact that in most crude oil/natural gas operational terminals/base in Nigeria and around the world, some quantities of the flared associated stranded natural gas stream are by-passed through a gas scrubber, to the gas turbine which supplies electricity to the entire terminal operations facilities, (b) the fact, that the demand for electricity, both domestically and industrially are very high, (c) the fact, that the generation of electricity from the flared associated stranded natural gas would immensely reduce the quantity released into the atmosphere hence reduce its contribution to greenhouse gas (GHG) causing global warming (d) the fact, that repeatedly, through various medium, a lot of people have stated the daily, monthly and yearly quantities of the Nigerian Associated Natural Gas being flared, as well as the financial losses associated with the continued flaring, the possible alternative power and industrial values of the flared natural gas, the environmental and health impacts associated with flaring.

Produced sand causes a lot of problems. From that reasons sand production must be monitored and kept within acceptable limits. Sand control problems in wells result from improper completion techniques or changes in reservoir properties. The idea is to provide support to the formation to prevent movement under stresses resulting from fluid flow from reservoir to well bore. That means that sand control often result with reduced well production. Control of sand production is achieved by: reducing drag forces (the cheapest and most effective method), mechanical sand bridging (screens, gravel packs) and increasing of formation strength (chemical consolidation). For open hole completions or with un-cemented slotted liners/screens sand failure will occur and must be predicted. Main problem is plugging. To combat well failures due to plugging and sand breakthrough Water-Packing or Shunt-Packing are used.
