The science and technology of materials in automotive engines provides an introductory text on the nature of the materials used in automotive engines. It focuses on reciprocating engines, both four and two stroke, with particular emphasis on their characteristics and the types of materials used in their construction. The book considers the engine in terms of each specific part: the cylinder, piston, camshaft, valves, crankshaft, connecting rod and catalytic converter. The materials used in automotive engines are required to fulfil a multitude of functions. It is a subtle balance between material properties, essential design and high performance characteristics. The science and technology of materials in automotive engines describes the metallurgy, chemical composition, manufacturing, heat treatment and surface modification of these materials. It also includes supplementary notes that support the core text. The book is essential reading for engineers and designers of engines, as well as lecturers and graduate students in the fields of automotive engineering, machine design and materials science looking for a concise, expert analysis of automotive materials. Provides a detailed introduction to the nature of materials used in automotive engines Essential reading for engineers, designers, lecturers and students in automotive engineering Written by a renowned expert in the field

The Peugeot 205 formed the basis of one of the great standard-setting hot hatches in the 1980s. Thornton describes each model in great detail and identifies year-by-year changes, as well as providing valuable information for inspecting and accurately assessing the cars condition and value prior to purchase. Comprehensive appendices cover technical specs, production numbers and performance figures.
