An Industrial Age model continues to shape the way the Army approaches its recruiting, personnel management, training, and education. This outdated personnel management paradigm—designed for an earlier era—has been so intimately tied to the maintenance of Army culture that a self-perpetuating cycle has formed, diminishing the Army's attempts to develop adaptive leaders and institutions. This cycle can be broken only if the Army accepts rapid evolutionary change as the norm of the new era. Recruiting the right people, then having them step into an antiquated organization, means that many of them will not stay as they find their ability to contribute and develop limited by a centralized, hierarchical organization. Recruiting and retention data bear this out. Several factors have combined to force the Army to think about the way it develops and nurtures its leaders. Yet, Vandergriff maintains, mere modifications to today's paradigm may not be enough. Today's Army has to do more than post rhetoric about adaptability on briefing slides and in literature. One cannot divorce the way the Army accesses, promotes, and selects its leaders from its leadership-development model. The Army cannot expect to maintain leaders who grasp and practice adaptability if these officers encounter an organization that is neither adaptive nor innovative. Instead, Army culture must become adaptive, and the personnel system must evolve into one that nurtures adaptability in its policies, practices, and beliefs. Only a detailed, comprehensive plan where nothing is sacred will pave the way to cultural evolution.

Essentials of Pharmaceutical Preformulation is a study guide which describes the basic principles of pharmaceutical physicochemical characterisation. Successful preformulation requires knowledge of fundamental molecular concepts (solubility, ionisation, partitioning, hygroscopicity and stability) and macroscopic properties (physical form, such as the crystalline and amorphous states, hydrates, solvates and co-crystals and powder properties), familiarity with the techniques used to measure them and appreciation of their effect on product performance, recognising that often there is a position of compromise to be reached between product stability and bioavailability. This text introduces the basic concepts and discusses their wider implication for pharmaceutical development, with reference to many case examples of current drugs and drug products. Special attention is given to the principles and best-practice of the analytical techniques that underpin preformulation (UV spectrophotometry, TLC, DSC, XRPD and HPLC). The material is presented in the typical order that would be followed when developing a medicine and maps onto the indicative pharmacy syllabus of the Royal Pharmaceutical Society of Great Britain Undergraduate-level pharmacy students and R&D / analytical scientists working in the pharmaceutical sector (with or without a pharmaceutical background) will find this text easy to follow with relevant pharmaceutical examples. Essential study guide for pharmacy and pharmaceutical science students Covers the pharmaceutical preformulation components of the Royal Pharmaceutical Society of Great Britain ' s indicative syllabus Easy to follow text highlighted with relevant pharmaceutical examples Self-assessment assignments in a variety of formats Written by authors with both academic and industrial experience Companion website with further information to maximise learning
