In France, a country that awards its intellectuals the status other countries give their rock stars, Michel Foucault was part of a glittering generation of thinkers, one which also included Sartre, de Beauvoir and Deleuze. One of the great intellectual heroes of the twentieth century, Foucault was a man whose passion and reason were at the service of nearly every progressive cause of his time. From law and order, to mental health, to power and knowledge, he spearheaded public awareness of the dynamics that hold us all in thrall to a few powerful ideologies and interests. Arguably his finest work, Archaeology of Knowledge is a challenging but fantastically rewarding introduction to his ideas.

Beschouwingen van de Franse filosoof, vertegenwoordiger van het structuralisme (1926-1984).

Possibly one off the most significant yet most overlooked works of the twentieth century, it was *The Order of Things* that established Foucault's reputation as an intellectual giant.

In this book Michel Foucault, one of the most influential thinkers of recent times, calls us to look critically at specific historical events in order to uncover new layers of significance. In doing so, he challenges our assumptions not only about history, but also about the nature of language and reason, even of truth. By analysing the methods of observation that underpinned the origins of modern medical techniques, Foucault is able to identify 'that opening up of the concrete individual, for the first time in Western history, to the language of rationality, that major event in the relationship of man to himself and of language to things'. The scope of such an undertaking is vast, but it is Foucault's skill that, by means of his uniquely engaging narrative style, his penetrating gaze is able to confront our own. After reading his words our perceptions are never quite the same again.

This book examines knowledge traditions that held together the fluid and overlapping maritime worlds of the Indian Ocean in the premodern period, as evident in the material and archaeological record. It breaks new ground by shifting the focus from studying cross-pollination of ideas from textual sources to identifying this exchange of ideas in archaeological and historical documentation. The themes covered in the book include conceptualization of the seas and maritime landscapes in Sanskrit, Arabic and Chinese narratives; materiality of knowledge production as indicated in the archaeological record of communities where writing on stone first appears; and anchoring the coasts, not only through an understanding of littoral shrines and ritual landscapes, but also by an analysis of religious imagery on coins, more so at the time of the introduction of new religions such as Islam in the Indian Ocean around the eighth century. This volume will be of great interest to researchers and scholars of archaeology, anthropology, museum and heritage studies, Indian Ocean studies, maritime studies, South and Southeast Asian studies, religious studies and cultural studies.

In the work that established him as the most important French thinker since Sartre, Michel Foucault offers startling evidence that "man"—man as a subject of scientific knowledge—is at best a recent invention, the result of a fundamental mutation in our culture. With vast erudition, Foucault cuts across disciplines and reaches back into seventeenth century to show how classical systems of knowledge, which linked all of nature within a great chain of being and analogies between the stars in the heavens and the features in a human face, gave way to the modern sciences of biology, philology, and political economy. The result is nothing less than an archaeology of the sciences that unearths old patterns of meaning and reveals the shocking arbitrariness of our received truths.
